

Below are the pictures of took of good and bad lighting in my community. The pictures are within 2 miles of my home. In looking for bad examples, I have noticed that my community is doing a great job in reducing stray light with covered fixtures. This is nice to see.

Bad Example 1

These are lights on the back of condos that I can see from my backyard. These lights are unshielded and have made meteor watching from my backyard nearly impossible once this complex was finished.

Bad Example 2

This is an example of a gas station in my neighborhood that has bad lighting.

Good Example 1

This is an example of a gas station, 1 block away from the above gas station that has good lighting. The lights are recessed yet illuminate the gas pumps with as much light as the other gas station.

Bad Example 3

This is an example of the city with bad lighting. They are trying to light up the recycling area with a minimum number of lights, hence, they spray light across the area instead of illuminating the ground with covered lights.

Good Example 2

This is an example of many of the newer shopping malls with good lighting.

Good Example 3

This is an example of a road sign, properly lit, setup by the state of Colorado. The lights are shielded and illuminate the sign with no stray light.
